## WAPH-Web Application Programming and Hacking

**Instructor: Dr. Phu Phung**

**Student**

**Name:** Nick Fishman

**Email:** fishmane@mail.uc.edu

**Short-bio:** Nick Fishman is an electrical engineering student with a specific interest in hardware and circuits.

### Repository Information

Repository's URL: <https://github.com/NickFishman04/waph.git>

This is a private repository for Nick Fishman to store all code from the course. The organization of this repository is as follows.

### Lab 0

Lab 0 Part 1:

1: Downloaded the VirtualBox application onto my computer from <https://www.virtualbox.org/wiki/Downloads> 2: Downloaded the ISO file for Ubuntu 22.04.5 from <http://linuxconfig.org/ubuntu-22-04-download> 3: Set up the virtual machine in VirtualBox, allocating a modest amount of system resources to it. 4: Installed Google Chrome from [google.com/chrome](http://google.com/chrome) in the preinstalled Firefox browser. 5: Installed Apache2, git, and sublime-text –classic onto the virtual machine. 6: Installed Pandoc and subsidiary systems with the commands specified in the lecture.

Lab 0 Part 2:

Git creation Go to GitHub, click New repository, name it, and make sure you choose Private instead of Public. Add a README if needed, then click Create repository. After that, copy the repo link so you can clone it to your VM later.

Exercises During the hands-on exercises, I generated SSH keys and added the public key to my GitHub account so my VM could securely connect to GitHub. I then cloned my remote repository into the VM, which allowed me to work with the project files locally. After cloning the repository, I edited the README.md
